

# Arduino™ Workshop

Door Ralph Bosmeier (PA1RB)

24 November 2014

# Doelstelling van deze workshop

- Kennismaken met het Arduino™ “eco-system”
- Een aantal toepassingen voor zendamateurs
- Zelf aan de slag met de basis I/O functies
- Gebruik van libraries
- De werking van de LC-meter
- Tips en bronnen voor verdere verdieping

# De bedenkers van Arduino

<http://spectrum.ieee.org/geek-life/hands-on/the-making-of-arduino>

# Het Arduino eco-systeem

- De Arduino <sup>TM</sup> microcontroller hardware en beschikbare “shields”
- De Interactive Development Environment (IDE) en de bootloader
- De <http://arduino.cc/> website
- Afgeleide “-duino” microcontroller hardware
- De enorme hoeveelheid aan periferie hardware
- Beschikbaarheid van talloze code libraries
- Zeer ruime beschikbaarheid van documentatie

# De Arduino UNO (rev 3)

<http://arduino.cc/en/Main/arduinoBoardUno>

0 – 13: Digital I/O

3, 5, 6, 9, 10, 11: can do PWM

0, 1: Hardware serial I/O

2,3: External interrupt

10, 11, 12, 13: SPI-bus

Digital

USB + Power

Power 6-20V

VIN (6-20V)

GND

5 Volt (source / input)

3.3V (source)

Reset

Power

A0 - A5: Analog in

A4, A5: I2C-bus ("two-wire")

Analog

# De Arduino Mega (2560)

<http://arduino.cc/en/Main/arduinoBoardMega2560>

Arduino UNO (rev 3)

**CONRAD** : € 23,90

**Aliexpress** : € 5,90  
Smarter Shopping. Better Living!

**Processor:** ATmega328 - 16 MHz  
**Flash:** 32 KB (0,5 KB bootloader)  
**SRAM:** 2 KB  
**EEPROM:** 1 KB  
**Digital I/O:** 14 (6 PWM)  
**Analog In:** 6  
**Serial:** SPI, I2C, 1 x UART

- Serial naar USB bridge
- 5 Volt I/O spanning

Arduino Mega (2560)

**CONRAD** : € 49,99

**Aliexpress** : € 10,30  
Smarter Shopping. Better Living!

**Processor:** ATmega2560 - 16 MHz  
**Flash:** 256 KB (8 KB bootloader)  
**SRAM:** 8 KB  
**EEPROM:** 4 KB  
**Digital I/O:** 54 (15 PWM)  
**Analog In:** 16  
**Serial:** SPI, I2C, 4 x UART

- Serial naar USB bridge
- 5 Volt I/O spanning

# Toepassingen voor zendamateurs

<http://www.arrl.org/ham-radio-for-arduino-and-picaxe>

- APRS Data Logger
- QRSS Beacon
- Multimode Transmitter Shield
- High Voltage, High Frequency, and High Temperature Data Logger
- Receive-Only, Low-Power APRS iGate
- PICAXE Keyer and CW Beacon Keyer
- Solar Tracker
- Nanokeyer
- Handheld Radio Talk Timer
- APRS Messenger
- DTMF Controlled SSTV Camera
- APRS Display
- Waterfall
- SWR Scanner

# Wat ik er zelf mee heb gedaan:

Besturing Magnetic Loop Antenne en een Antenne analyzer

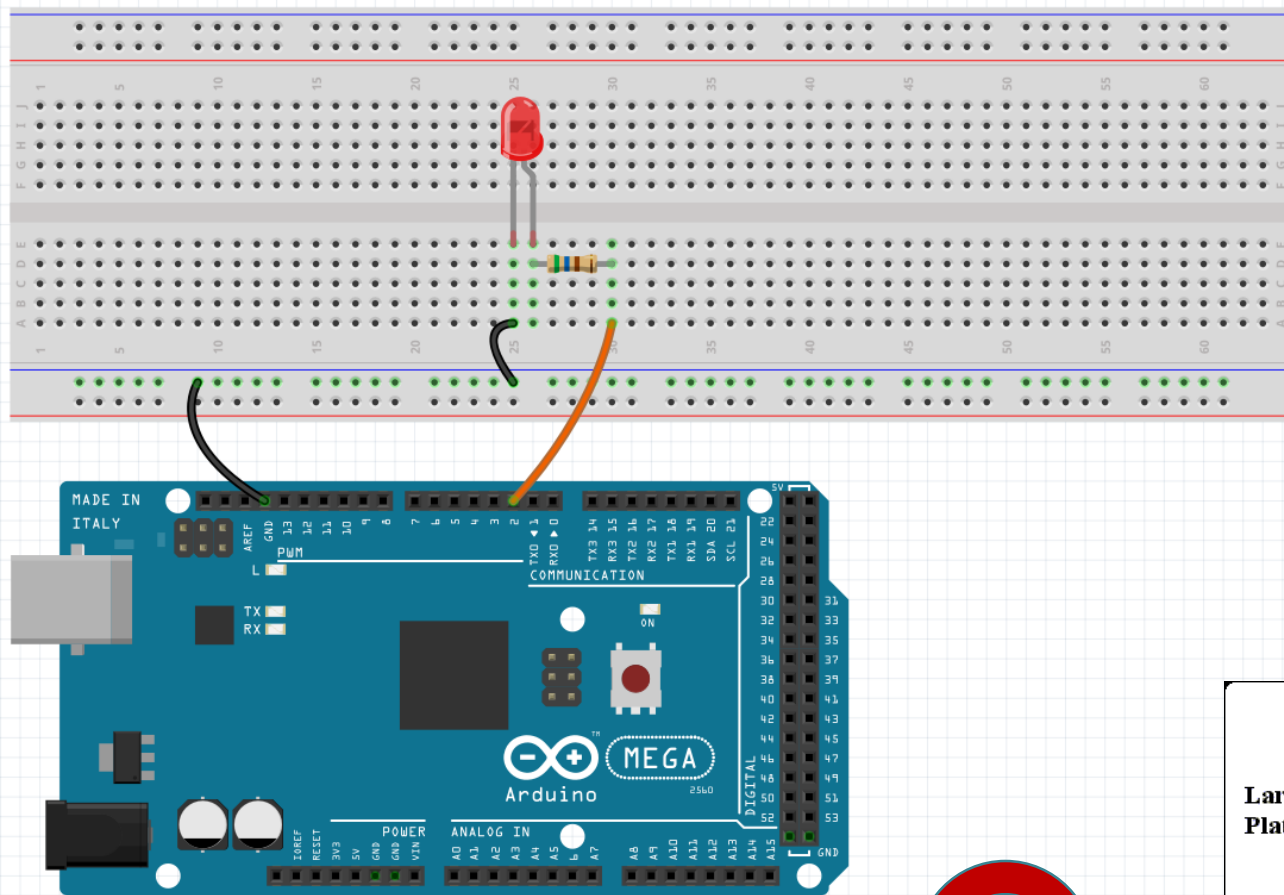

# Aan de slag !

# Het MB-102 Breadboard

# Circuit voor LED\_Blink

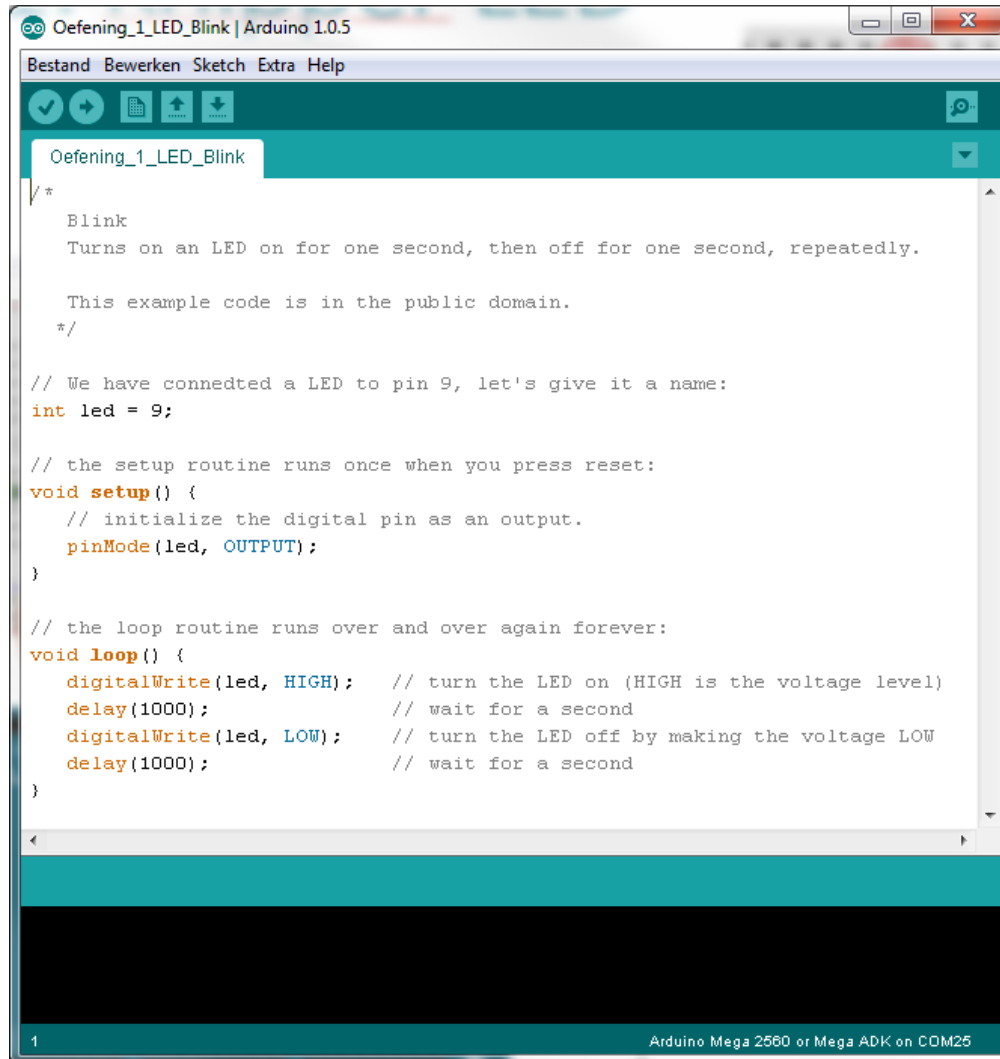

Absoluut maximum van 40 mA source / sink per I/O pin  
Maximum van 20 mA source / sink per pin wordt echter aanbevolen  
 $5\text{ V} / 560\ \Omega = 9\text{ mA}$ , (buffering is dus niet nodig in dit geval).

Zie: <http://arduino-info.wikispaces.com/ArduinoPinCurrent>

# De Arduino IDE

## (Integrated Development Environment)

(= het C++ -programma)

Error window

Verbonden board

# De IDE instellen voor de MEGA 2560

# Oefening 1: LED\_Blink

## Digitale uitgang (**digitalWrite()**)

```
/*  
  Blink  
  Turns on an LED on for one second, then off for one second, repeatedly.  
  
  This example code is in the public domain.  
  */  
  
// We have connected a LED to pin 2, let's give it a name:  
int led = 2;  
  
// the setup routine runs once:  
void setup()  
{  
  pinMode(led, OUTPUT); // initialize the digital pin as an output.  
}  
  
// the loop routine runs over and over again forever:  
void loop()  
{  
  digitalWrite(led, HIGH); // turn the LED on (HIGH is the voltage level)  
  delay(1000);             // wait for a second  
  digitalWrite(led, LOW);  // turn the LED off by making the voltage LOW  
  delay(1000);             // wait for a second  
}
```

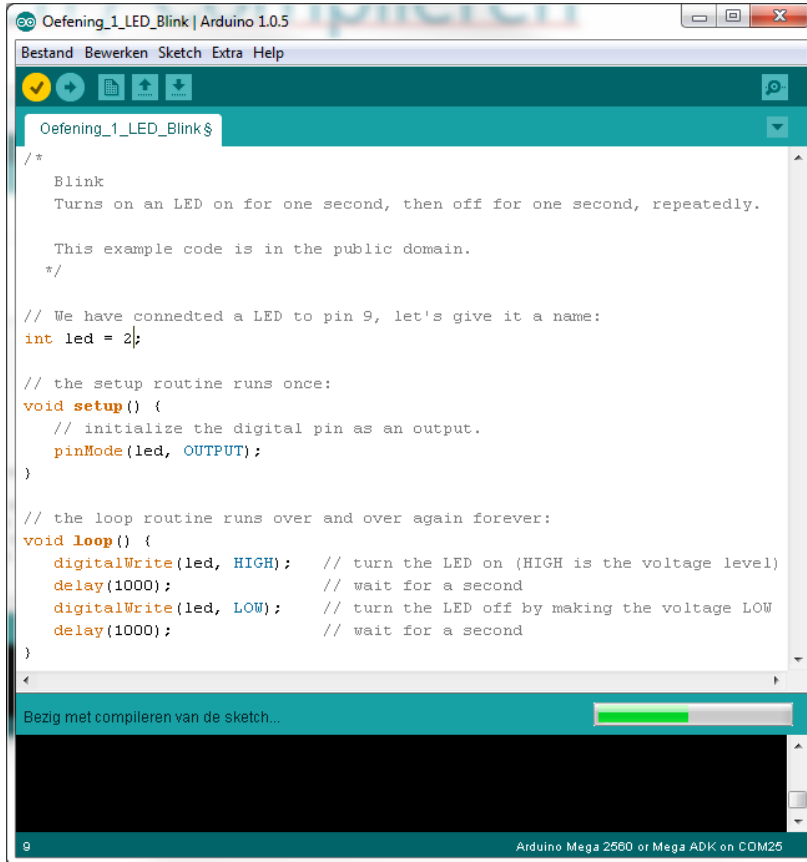

<http://arduino.cc/en/Tutorial/DigitalPins>

<http://arduino.cc/en/Reference/digitalWrite>

# Controleren / Compileren

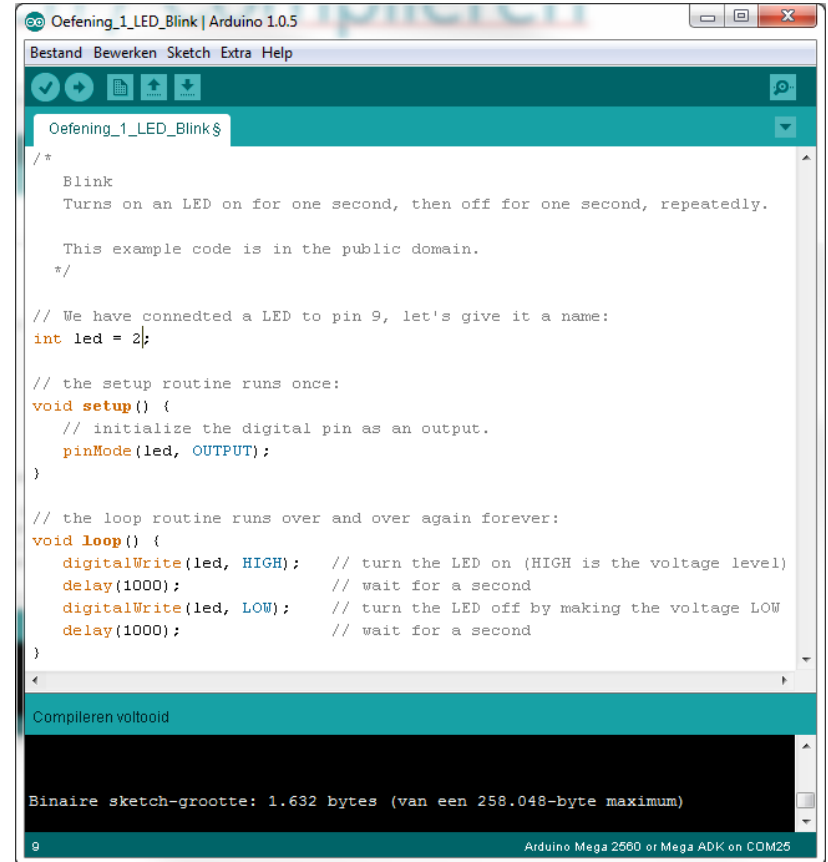

The screenshot shows the Arduino IDE interface with the file 'Oefening\_1\_LED\_Blink' open. The code is a standard Arduino sketch for blinking an LED. The status bar at the bottom indicates 'Arduino Mega 2560 or Mega ADK on COM25'. The bottom panel shows a progress bar for 'Bezig met compileren van de sketch...' (Compiling sketch...).

```
/*  
  Blink  
  Turns on an LED on for one second, then off for one second, repeatedly.  
  
  This example code is in the public domain.  
  */  
  
// We have connected a LED to pin 9, let's give it a name:  
int led = 2;  
  
// the setup routine runs once:  
void setup() {  
  // initialize the digital pin as an output.  
  pinMode(led, OUTPUT);  
}  
  
// the loop routine runs over and over again forever:  
void loop() {  
  digitalWrite(led, HIGH); // turn the LED on (HIGH is the voltage level)  
  delay(1000);             // wait for a second  
  digitalWrite(led, LOW);  // turn the LED off by making the voltage LOW  
  delay(1000);             // wait for a second  
}
```

Bezig met compileren van de sketch...

9 Arduino Mega 2560 or Mega ADK on COM25

The screenshot shows the same Arduino IDE interface, but the compilation is complete. The status bar at the bottom indicates 'Arduino Mega 2560 or Mega ADK on COM25'. The bottom panel shows 'Compileren voltooid' (Compilation complete) and the binary size: 'Binaire sketch-grootte: 1.632 bytes (van een 258.048-byte maximum)'.

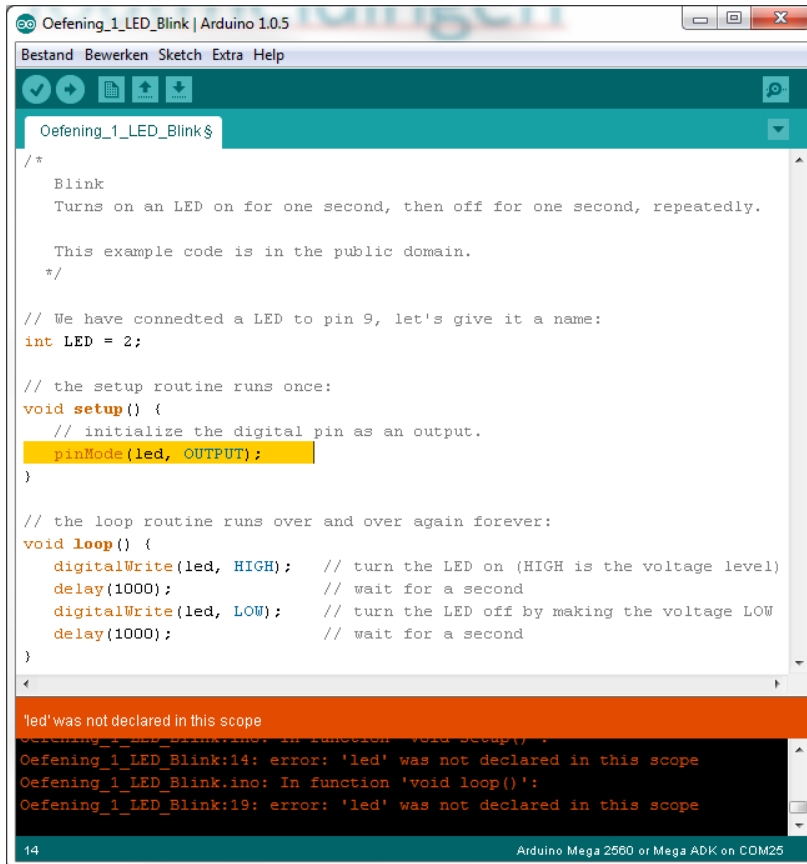

```
/*  
  Blink  
  Turns on an LED on for one second, then off for one second, repeatedly.  
  
  This example code is in the public domain.  
  */  
  
// We have connected a LED to pin 9, let's give it a name:  
int led = 2;  
  
// the setup routine runs once:  
void setup() {  
  // initialize the digital pin as an output.  
  pinMode(led, OUTPUT);  
}  
  
// the loop routine runs over and over again forever:  
void loop() {  
  digitalWrite(led, HIGH); // turn the LED on (HIGH is the voltage level)  
  delay(1000);             // wait for a second  
  digitalWrite(led, LOW);  // turn the LED off by making the voltage LOW  
  delay(1000);             // wait for a second  
}
```

Compileren voltooid

Binaire sketch-grootte: 1.632 bytes (van een 258.048-byte maximum)

9 Arduino Mega 2560 or Mega ADK on COM25

# Eventuele foutmeldingen

The screenshot shows the Arduino IDE interface with the file 'Oefening\_1\_LED\_Blink.ino' open. The code is a standard blink sketch. The variable 'led' is declared in the 'setup' function but used in the 'loop' function. A red error message is displayed at the bottom: 'led' was not declared in this scope. The error message is repeated for two locations: line 14 in the 'void setup()' function and line 19 in the 'void loop()' function. The status bar at the bottom indicates '14' and 'Arduino Mega 2560 or Mega ADK on COM25'.

```
/*
 * Blink
 * Turns on an LED on for one second, then off for one second, repeatedly.

 * This example code is in the public domain.
 */

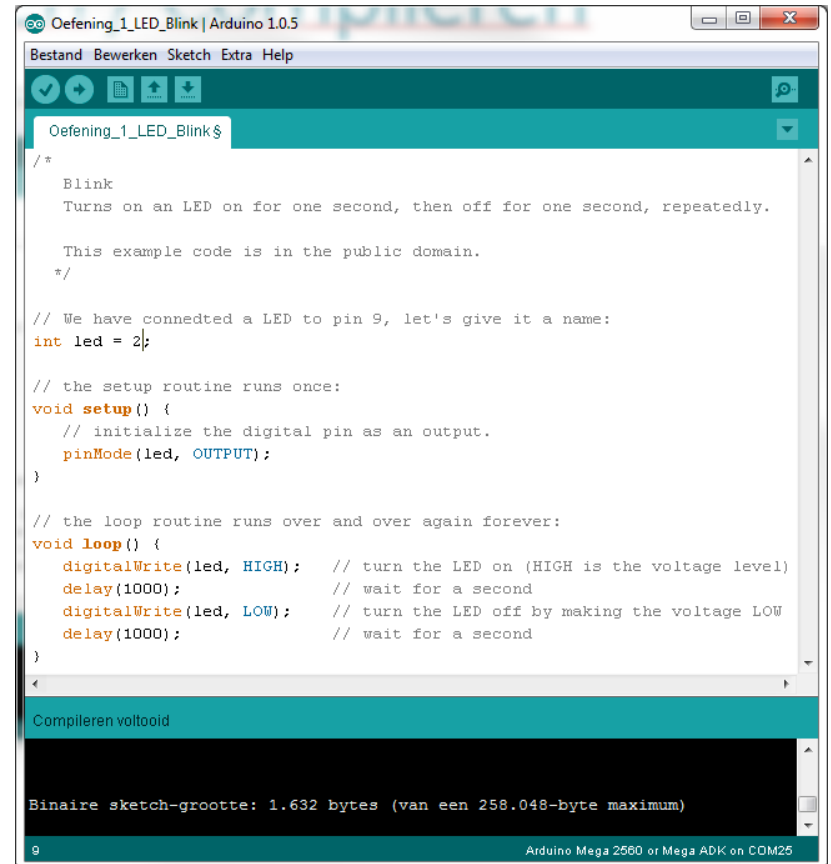

// We have connected a LED to pin 9, let's give it a name:
int LED = 2;

// the setup routine runs once:
void setup() {
  // initialize the digital pin as an output.
  pinMode(LED, OUTPUT);
}

// the loop routine runs over and over again forever:
void loop() {
  digitalWrite(LED, HIGH); // turn the LED on (HIGH is the voltage level)
  delay(1000);             // wait for a second
  digitalWrite(LED, LOW);  // turn the LED off by making the voltage LOW
  delay(1000);             // wait for a second
}
```

'led' was not declared in this scope  
Oefening\_1\_LED\_Blink.ino: In function 'void setup()':  
Oefening\_1\_LED\_Blink:14: error: 'led' was not declared in this scope  
Oefening\_1\_LED\_Blink.ino: In function 'void loop()':  
Oefening\_1\_LED\_Blink:19: error: 'led' was not declared in this scope

14 Arduino Mega 2560 or Mega ADK on COM25

The screenshot shows the same Arduino IDE interface with the file 'Oefening\_1\_LED\_Blink.ino' open. The code is identical to the previous one, but the variable 'led' is now correctly declared as 'int led = 2;'. The compilation is successful, and the status bar at the bottom indicates '9' and 'Arduino Mega 2560 or Mega ADK on COM25'.

```
/*
 * Blink
 * Turns on an LED on for one second, then off for one second, repeatedly.

 * This example code is in the public domain.
 */

// We have connected a LED to pin 9, let's give it a name:
int led = 2;

// the setup routine runs once:
void setup() {
  // initialize the digital pin as an output.
  pinMode(led, OUTPUT);
}

// the loop routine runs over and over again forever:
void loop() {
  digitalWrite(led, HIGH); // turn the LED on (HIGH is the voltage level)
  delay(1000);             // wait for a second
  digitalWrite(led, LOW);  // turn the LED off by making the voltage LOW
  delay(1000);             // wait for a second
}
```

Compileren voltooid

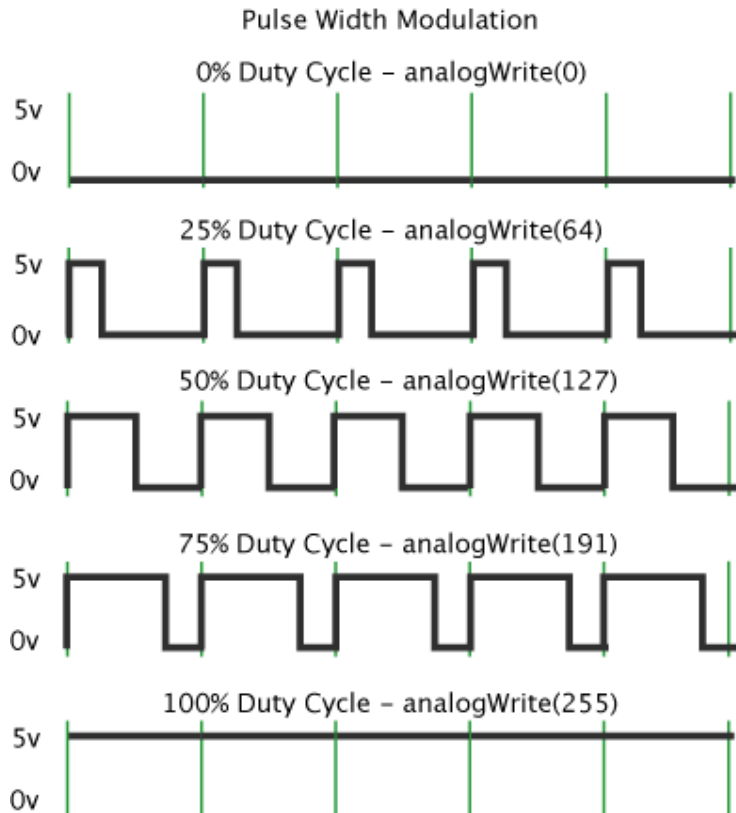

Binaire sketch-grootte: 1.632 bytes (van een 258.048-byte maximum)

9 Arduino Mega 2560 or Mega ADK on COM25

# Uploaden van een sketch

# Oefening 2: LED\_Dimmer

PWM uitgang ( `analogWrite()` )

De Arduino UNO / Mega hebben geen “echte” D/A convertor aan boord, maar veel pinnen kunnen wel Pulse Wide Modulation (PWM) uitsturen (490 / 980 Hz)

We gebruiken hetzelfde circuit als voor LED\_Blink, maar nu met een andere sketch.

<http://arduino.cc/en/Tutorial/PWM>

<http://arduino.cc/en/Reference/analogWrite>

# Oefening 2: LED\_Dimmer

PWM uitgang ( `analogWrite()` )

```
int ledPin = 2;           // LED connected to digital pin 2
int counter = 0;          // counter value
boolean countingUp = true; // Track the direction

void setup()
{
  pinMode(ledPin, OUTPUT); // sets the pin as output
}

void loop()
{
  if (countingUp == true && counter < 255)
  {
    counter++;           // counter = counter + 1
    analogWrite(ledPin, counter); // analogWrite values from 0 to 255
    delay(10);           // delay in ms
  }
  ...
}
```

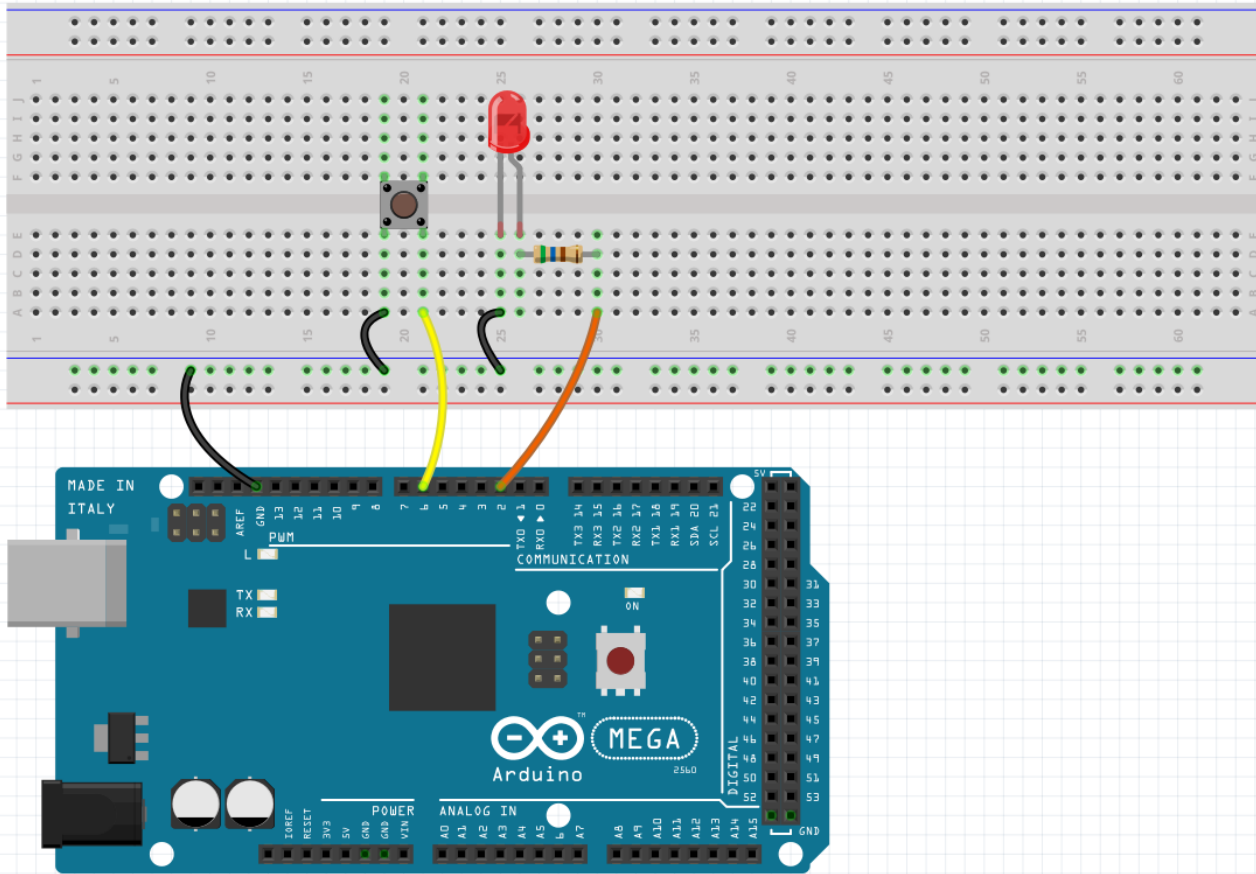

Definitie van pinnen en variabelen

Zet pin in output mode

Zet de PWM duty-cycle met `analogWrite()`

# Circuit voor Digital\_Input

# Oefening 3: Digital\_Input

## (digitalRead())

```
void setup()
{
  ...
  pinMode(buttonPin, INPUT_PULLUP);
  ...
}

void loop()
{
  if (digitalRead(buttonPin) == HIGH)
  {
    ...
  }
  ...
}
```

Je kunt zelf een pull-up weerstand in de schakeling opnemen (aanbevolen waarde 10K Ohm), of een interne pull-up weerstand in de microcontroller inschakelen, (waarde ligt typisch tussen 20K en 50K Ohm)

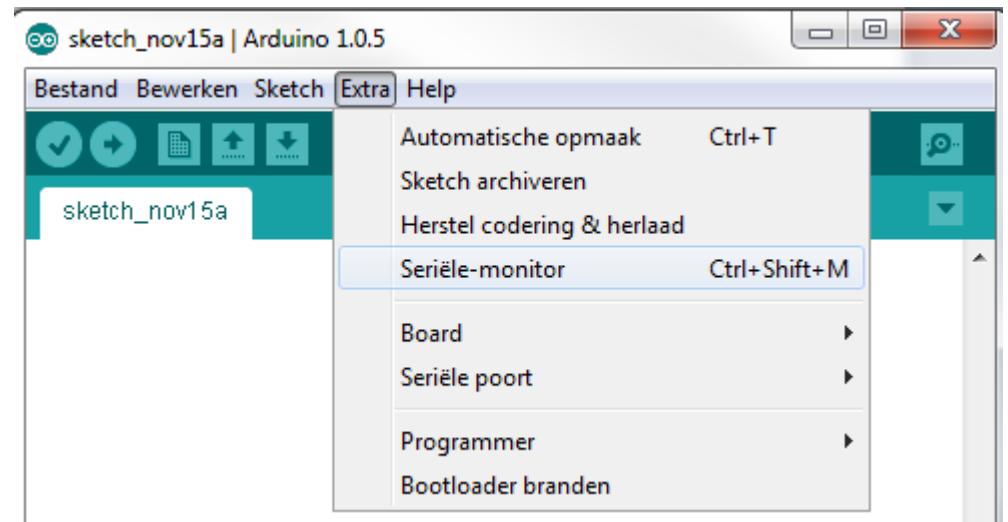

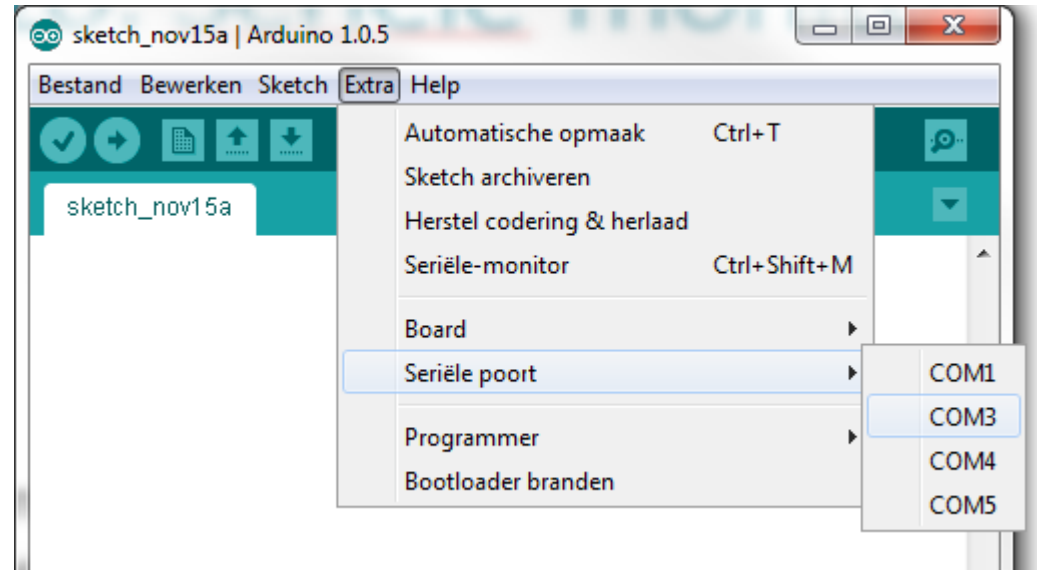

<http://arduino.cc/en/Tutorial/DigitalPins>  
<http://arduino.cc/en/Reference/pinMode>  
<http://arduino.cc/en/Reference/digitalRead>

# Intermezzo 1: Seriële-monitor

```
int counter = 0;

void setup()
{
  // initialize serial communication
  // at 9600 bits per second
  Serial.begin(9600);
}

void loop()
{
  Serial.println(counter);
  counter++;
  delay(1000);
}
```

# Circuit voor Analog\_Input

# Oefening 4: Analog\_Input

## (`analogRead()`)

```
int sensorValue;  
float voltage;  
  
void setup()  
{  
  Serial.begin(9600);  
}  
  
void loop()  
{  
  sensorValue = analogRead(A0);  
  voltage = sensorValue * (5.0 / 1023.0);  
  Serial.println(voltage);  
  delay(500);  
}
```

<http://arduino.cc/en/Tutorial/AnalogInputPins>

<http://arduino.cc/en/Tutorial/ReadAnalogVoltage>

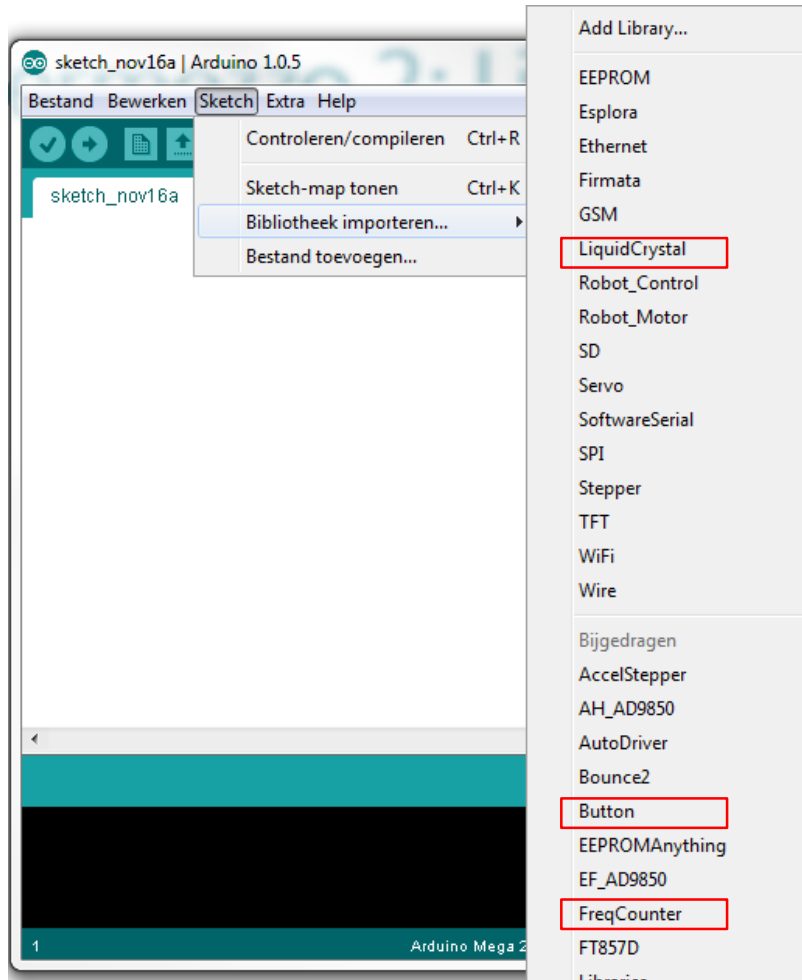

# Tussenstand van de workshop

1. De Integrated Development Environment (IDE)
2. Digitale output      `digitalWrite()`
3. PWM output        `analogWrite()`
4. Digitale input      `digitalRead()`
5. Analoge input      `analogRead()`
6. De seriële monitor

# Even pauze !

10 minuten welverdiende bio-break

# Intermezzo 2: Libraries

Libraries bevatten herbruikbare code waardoor het gebruik van allerlei hardwarecomponenten een heel stuk eenvoudiger wordt.

De Arduino IDE komt standard met een aantal veelgebruikte libraries, ondermeer LiquidCrystal voor alfanumerieke LCD's.

Andere libraries zijn eenvoudig toe te voegen.

Wij voegen de Button en FreqCounter libraries toe.

# Circuit voor LCD 1602 (16x2)

2 regels \* 16 karakters alfanumeriek display  
Aan te sturen via 4-bit of 8-bit databus  
Met backlight

Gebaseerd op Hitachi HD44780 controller  
(of compatible).

Aansluitschema op L/C shield

<https://www.sparkfun.com/datasheets/LCD/HD44780.pdf>

# Oefening 5: LCD\_display

```
#include <LiquidCrystal.h> // include the library code

// initialize the library with the numbers of the interface pins
// parameters: (rs, enable, d4, d5, d6, d7)
LiquidCrystal lcd(13, 12, 11, 10, 9, 8);

void setup()
{
  // set up the LCD's number of columns and rows:
  lcd.begin(16, 2);
  lcd.print("Hello, world!"); // Print a message to the LCD.
}

void loop()
{
  // set the cursor to column 0, line 1
  // (note: counting begins with 0):
  lcd.setCursor(0, 1);
  // print the number of seconds since reset:
  lcd.print(millis()/1000);
}
```

Voeg de library code in

Creeer een object “lcd”, en geeft daarbij aan hoe deze met de hardware is verbonden.

Gebruik het object middels zijn methoden, zoals:

➤ lcd.begin()

➤ lcd.print()

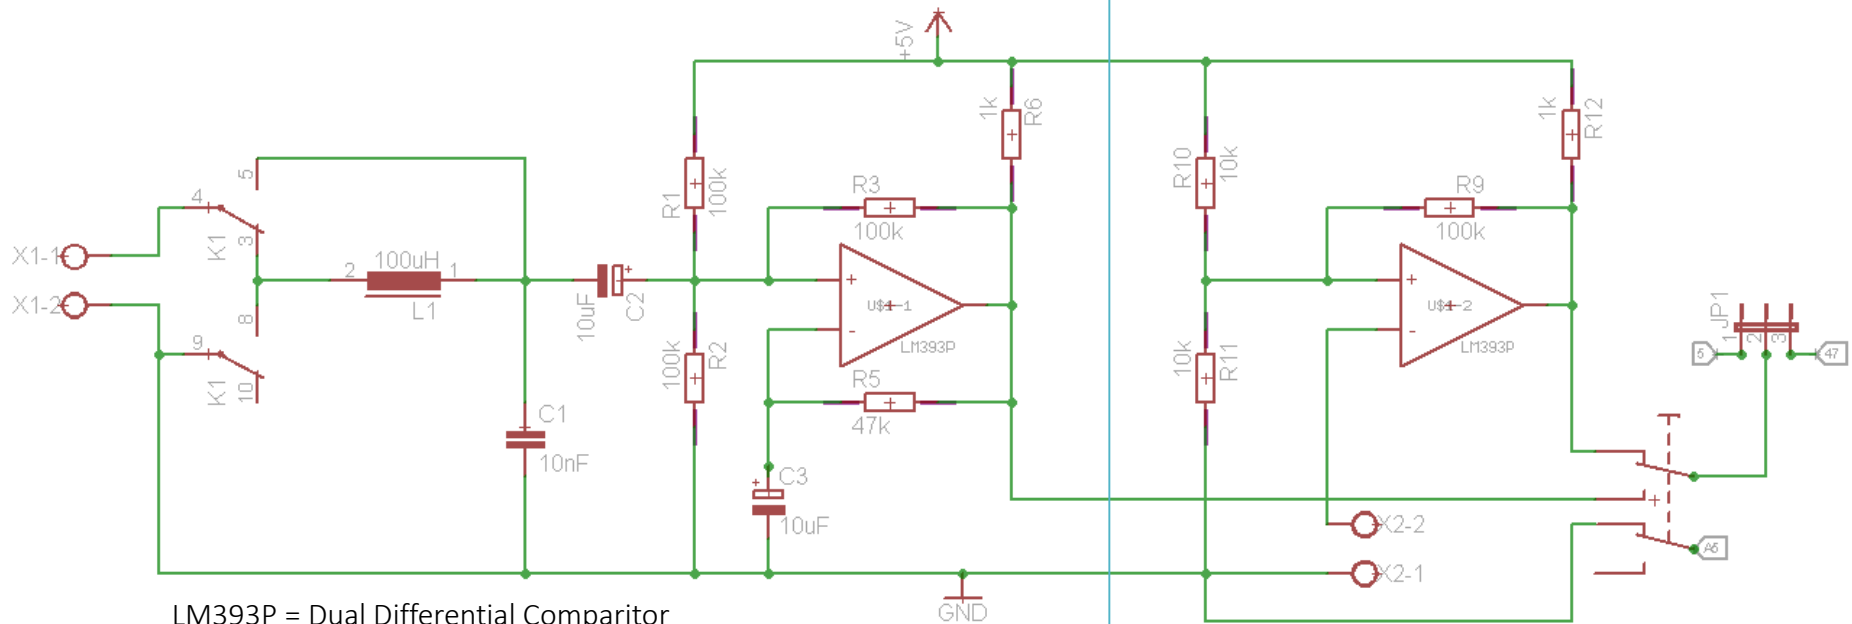

➤ lcd.setCursor()

➤ ...

<http://arduino.cc/en/Tutorial/LiquidCrystal>

<http://arduino.cc/en/Reference/LiquidCrystal>

# L/C-meter shield

$$f_{res} = \frac{1}{2\pi\sqrt{LC}} = 159 \text{ Khz}$$

$C_{ref}$  is gegeven,  $L_{ref}$  wordt berekend

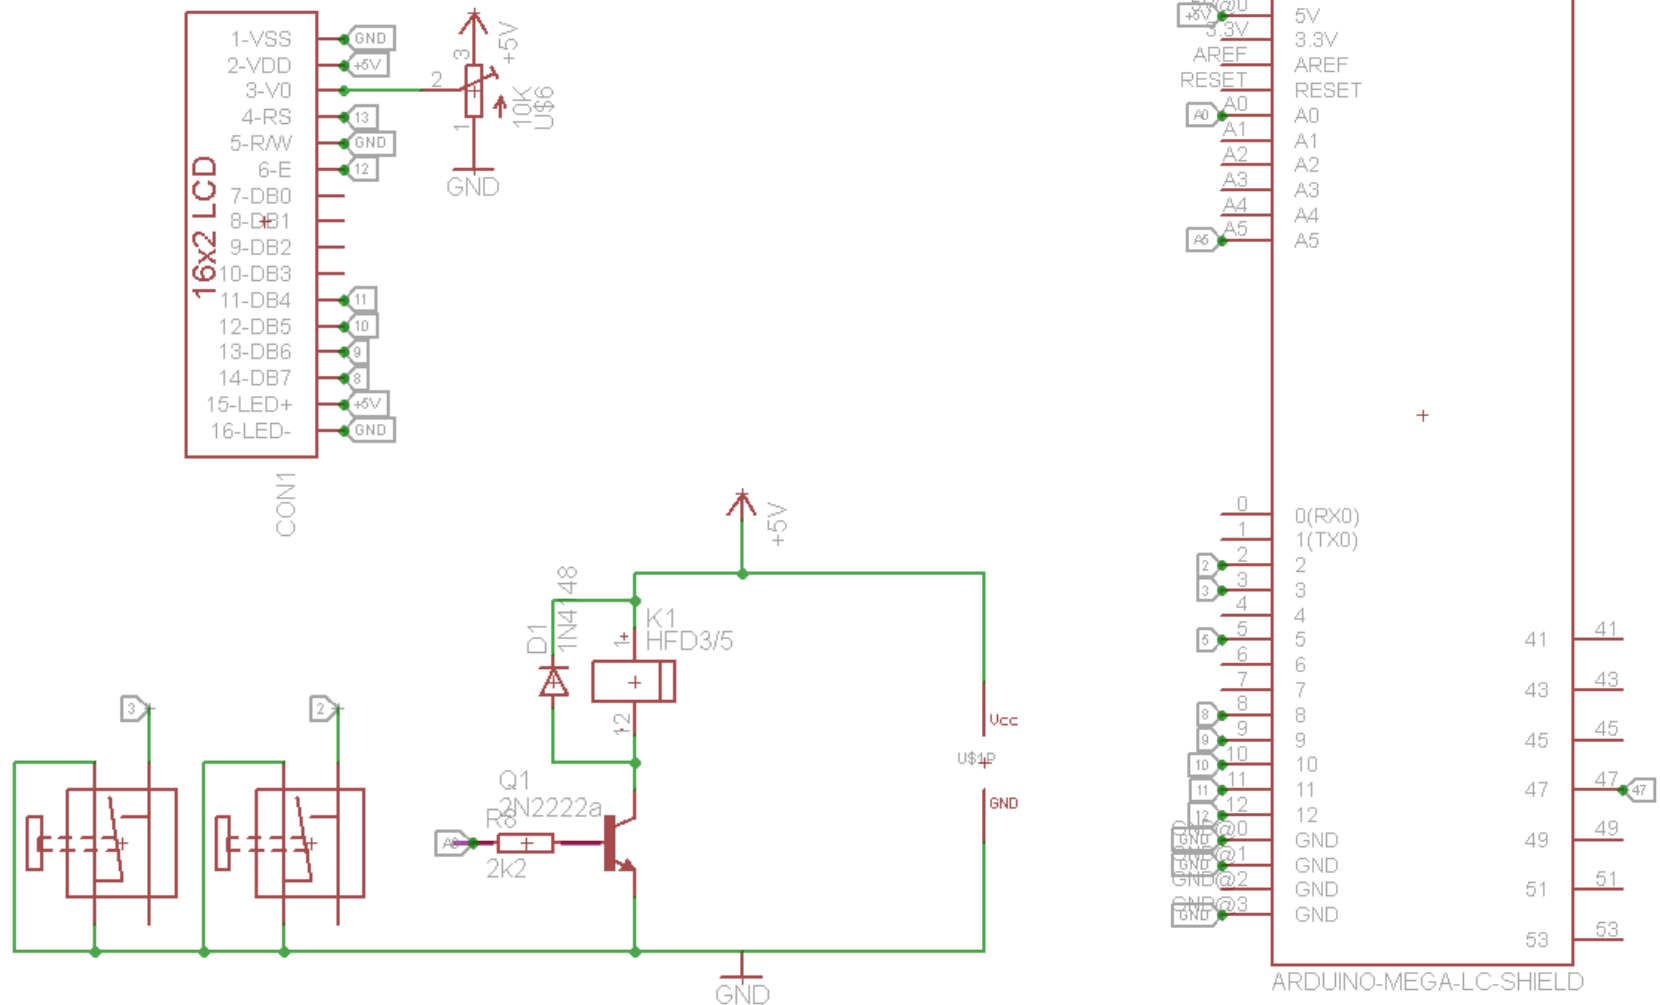

<http://www.kerrywong.com/2010/10/16/avr-lc-meter-with-frequency-measurement/>

<http://langster1980.blogspot.nl/2013/07/arduino-lc-meter-shield.html>

<http://www.ti.com.cn/cn/lit/ds/symlink/lm393.pdf>

# L/C-meter shield

# De FreqCounter Library

```
//Measure the frequency

FreqCounter::f_comp=10; // Calibrate Value
FreqCounter::start(1000); // 1000 ms Gate Time

while (FreqCounter::f_ready == 0);

frq=FreqCounter::f_freq;

lcd.setCursor(0, 0);
lcd.print("Frequency ");
lcd.setCursor(0, 1);
lcd.print(frq);
```

Let op, deze library maakt gebruik van een vast gedefinieerde hardware counter pin.

Arduino UNO: pin 5  
Arduino Mega: pin 47

<http://interface.khm.de/index.php/lab/experiments/arduino-frequency-counter-library/>  
<http://forum.arduino.cc/index.php?topic=38126.10;wap2> (Mega 2560 patch)

# Wat hebben we vanavond gedaan:

- Overzicht van het Arduino eco-system
- Toepassingen voor zendamateurs
- De Arduino IDE (Integrated Development Environment)
- Gebruik van de basis I/O functies
- De serieële monitor
  - pauze*
- Het gebruik van libraries en de relatie met hardware
- Alfnummerieke LCD aansturen (liquidCrystal library)
- De werking van het L/C shield

Ik wil meer !
