Zendamateurs en CubeSat's

Agenda

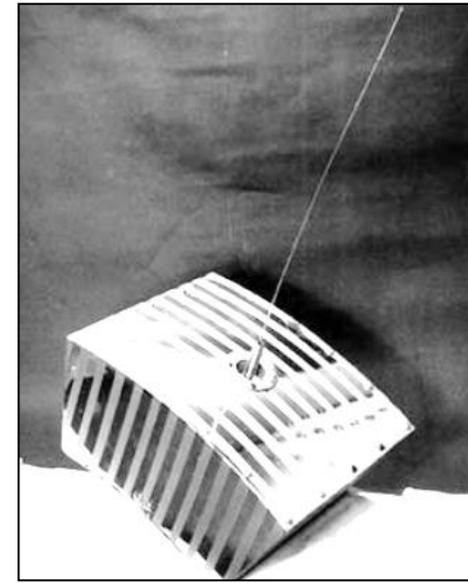

- **Amateur satellieten**
- **Wat is een Cubesat?**
- **Satellietbanen**
- **Doppler**
- **Software & Apparatuur**

- **Demonstratie**

- **Zendamateurs en cubesat's**
- **Vragen**

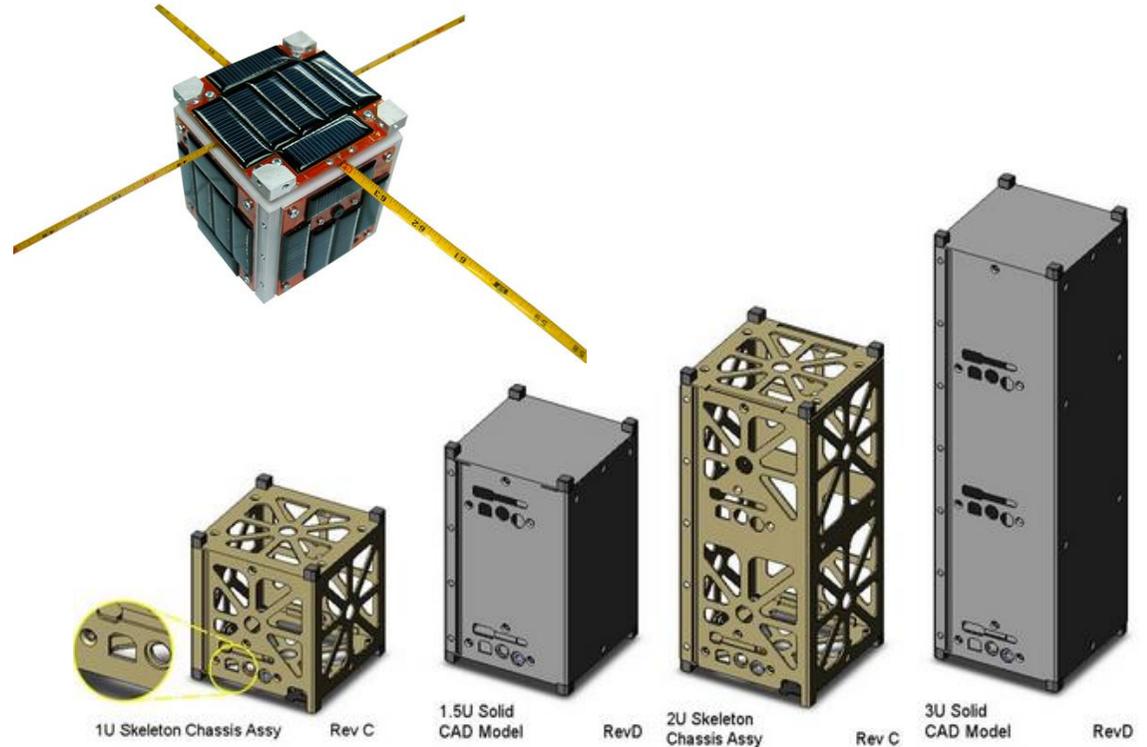

Amateur satellieten

- Eerste: OSCAR-1 - 1961
- Grootste: AO-40: 450kg - HEO - Ariane 5
- Oudst werkende: AO-7 - 1974
- Duur – 2nd payload
- FunCubes: kleiner, goedkoper
- NL: Delfi-C3, Delfin3Xt, AO-73 (FunCube-1) !

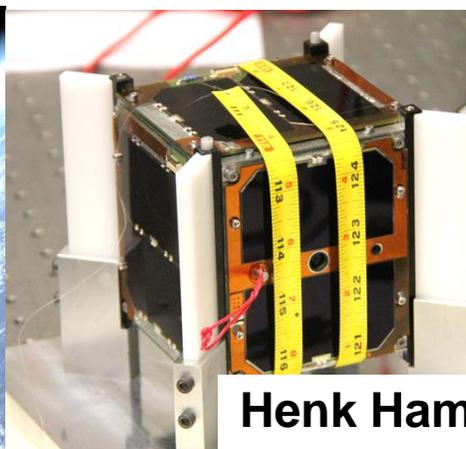

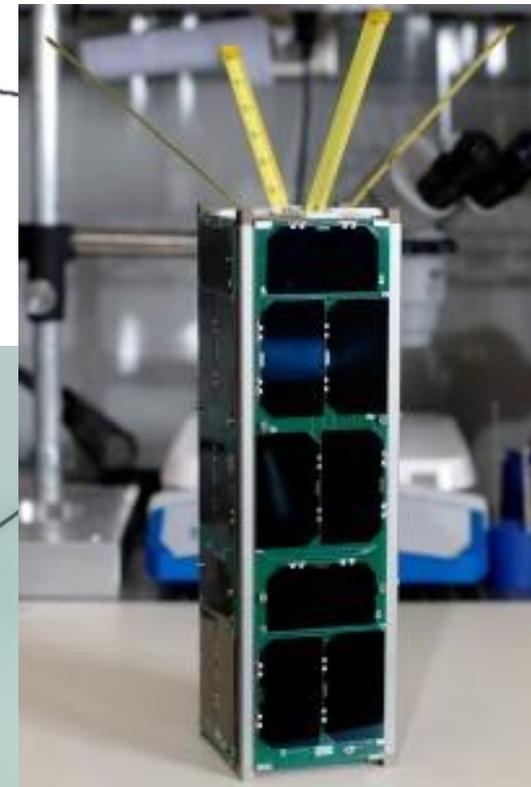

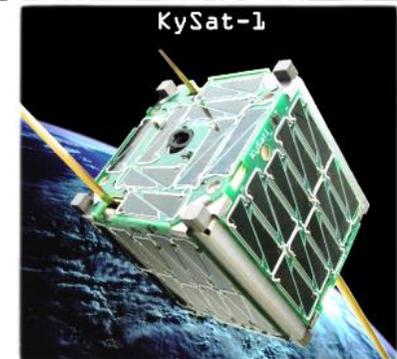

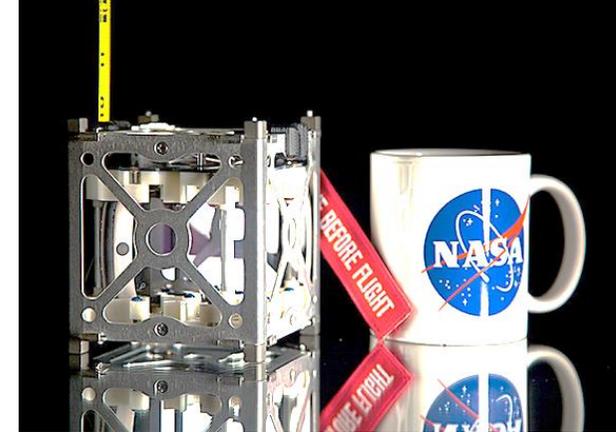

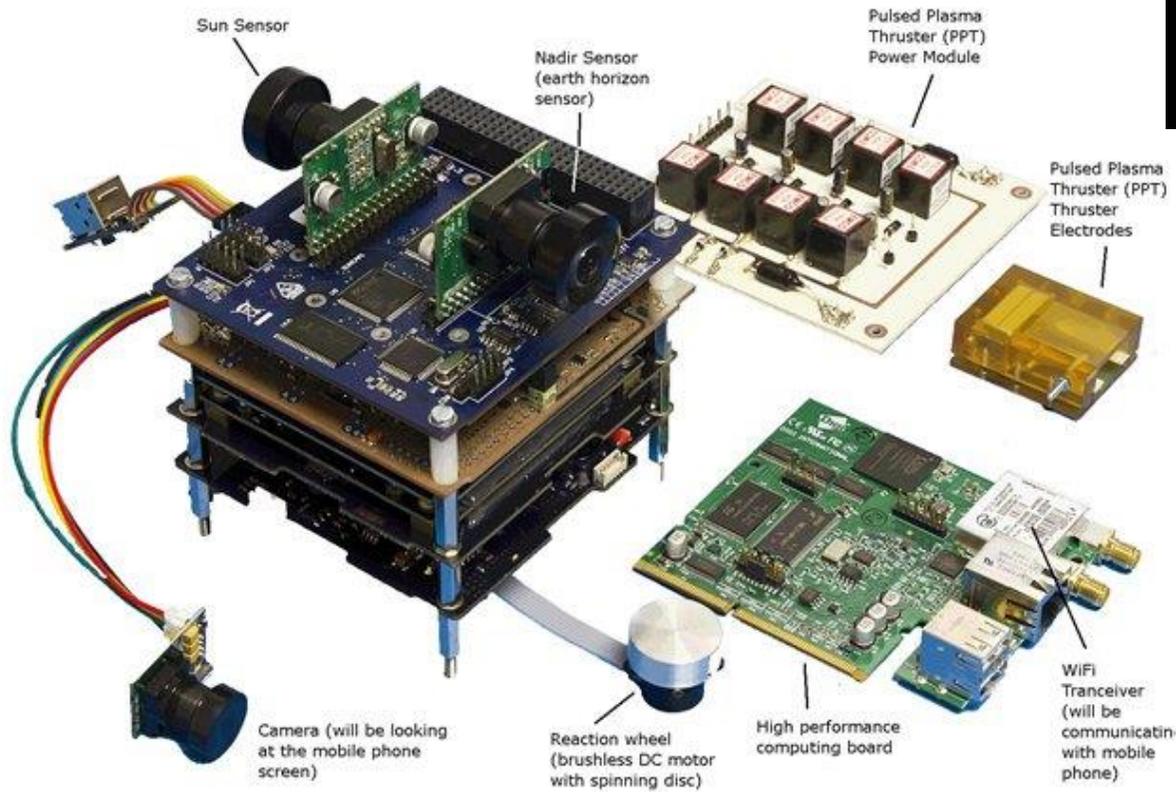

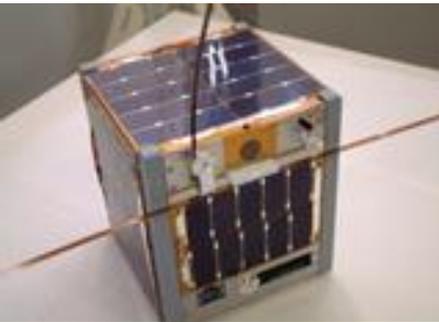

Wat is een Cubesat ?

- Stanford University
- Prof. Twiggs - 1998
- <1.33 kg
- 10 x 10 x 10 cm units
- 1U, 2U, 3U, 6U, ...
- Launch Mechanism: Poly-PicoSatellite Orbital Deployer (P-POD)
- First launch: 30 Juni 2003
- Support Hands-on University-level Space Education
- 40+ launched, 300+ in development

CUBESAT ELaNu VI LAUNCH ON L-36 Mission

CubeSat Deployment

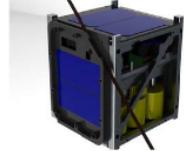

Four CubeSat projects were selected for the ELaNu VI mission. The NRO funded the Naval Postgraduate School to develop NPS-CuL, which can attach up to eight P-PODS to a single adaptor. This allows up to 24 single-unit (1U) CubeSats to be launched at one time. The CubeSats on OUTSat are sponsored by either the NRO Mission Support Directorate or NASA's Launch Services Program. The P-POD was designed and manufactured by the California Polytechnic State University (Cal Poly) to integrate CubeSats onto the launch vehicle. This P-POD design has flown previously on Defense Department, NASA, and commercial launches. For NASA, Cal Poly integrates the CubeSats with the P-POD and provides the entire assembly to the launch vehicle integrator.

CXEN was developed and built by Morehead State University in Kentucky. Its primary purpose is to increase the precision of measurements of the Cosmic X-Ray Background in the 30-50keV range. CXEN also will provide a short-duration supplement to NASA's Radiation Belt Storm Probes mission and is outfitted with state-of-the-art Cadmium Zinc Telluride-based x-ray and gamma-ray detectors.

Mission Overview

NASA is partnering with the National Reconnaissance Office (NRO) to launch small research satellites, or CubeSats, for four universities on the third installment of the Educational Launch of Nanosatellite (ELaNu) mission. The Launch Services Program at NASA's Kennedy Space Center in Florida manages the ELaNu missions. The CubeSats will be flown as part of the Operationally Unique Technologies Satellite, or OUTSat, an auxiliary payload aboard the Atlas V 401 rocket scheduled to lift off Aug. 2. Three Poly Picosatellite Orbital Deployers, or P-PODs, will carry and deploy the ELaNu VI CubeSats.

After the main payload deploys, the CubeSats will separate from their P-PODs. After 45 minutes in orbit, the CubeSat transmitters will turn on and university ground stations will listen for their beacons, determine the small satellites' functionality and announce operational status. CubeSat mission durations and orbital life vary, but are anticipated to last at least 180 days. Upon mission completion, the CubeSats fall to Earth, burning up in the atmosphere.

CPS was developed and built by the California Polytechnic State University in San Luis Obispo. Its primary purpose is to test a deployable spacecraft de-orbiting a thin-film mechanism consisting of a miniature solar sail. After the sail deploys, observations will be made from the ground to detect any altitude or velocity degradation of the spacecraft.

Basic CubeSat Facts:

- Built to standard dimensions of 1 unit, or 1U, which is equal to 10x10x11 cm
- Can be 1U, 2U, 3U, or 6U in size
- Weigh less than 1 1/3 kg (3 lbs) per U—6U may be up to 13-14 kg
- Deployed from standard Poly-Picosatellite Orbital Deployer (P-POD)

NASAfacts

Satellietbanen

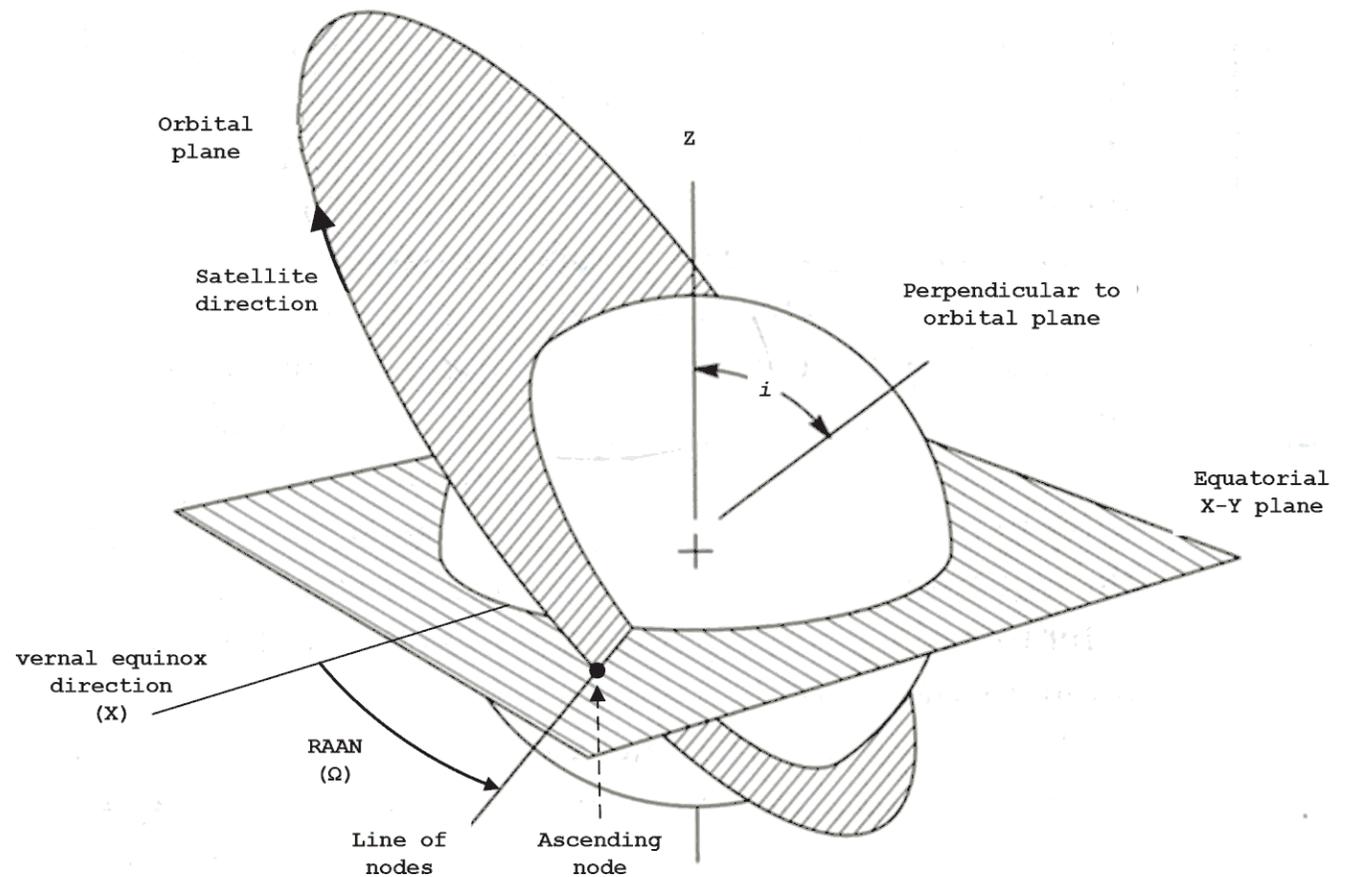

LEO = Low Earth Orbit
HEO = High Earth Orbit

Ellipse-vormig

- Voor LEO-satellieten bijna rond (Low Earth Orbit)

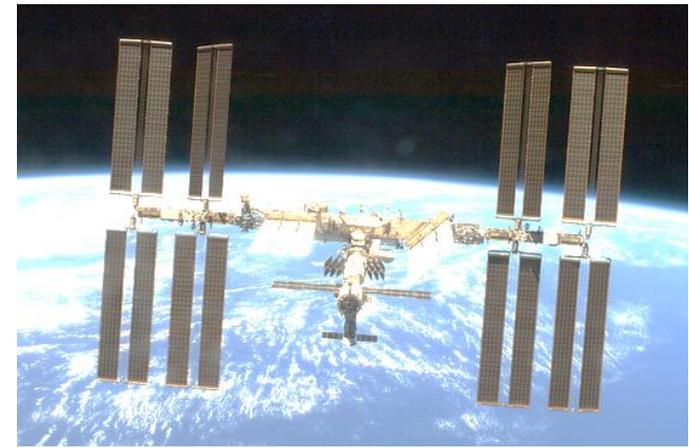

6 baan-parameters

- Soort baan:
 - Inclination
 - Mean Motion
 - Eccentricity
- Positie baan:
 - RAAN
 - Argument of perigee
- Positie satelliet:
 - Mean Anomaly

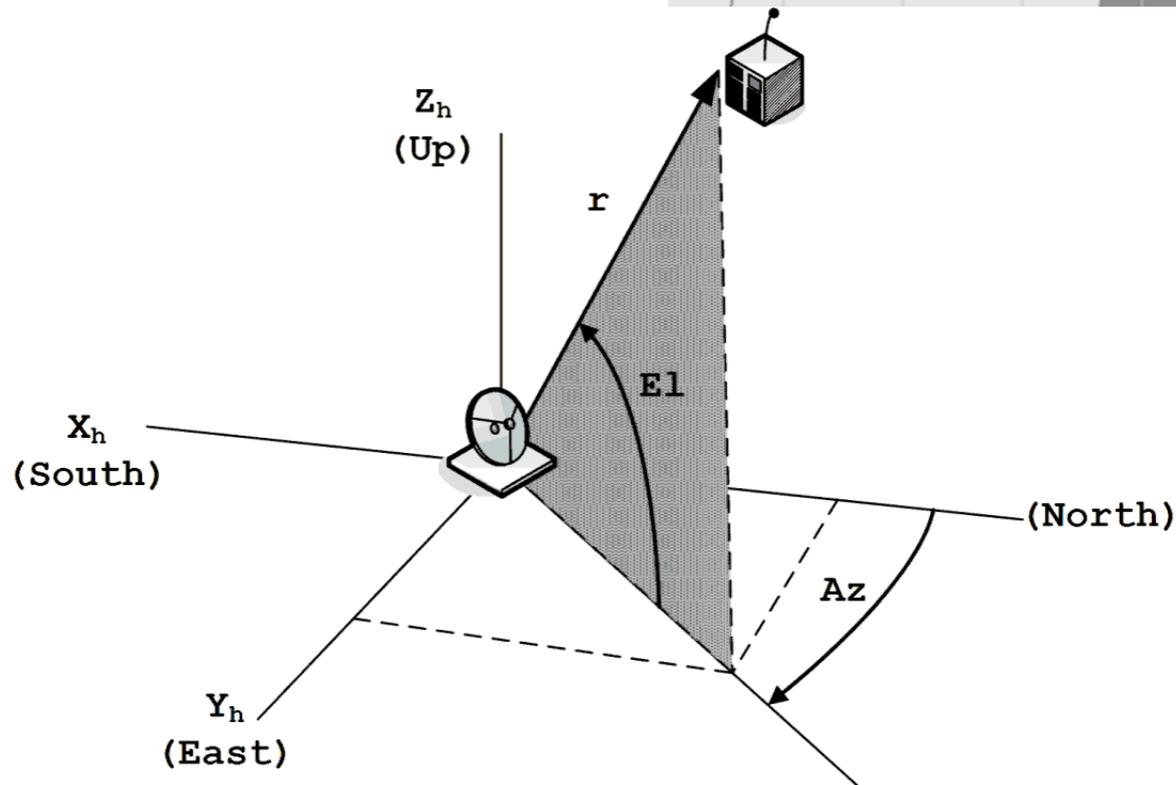

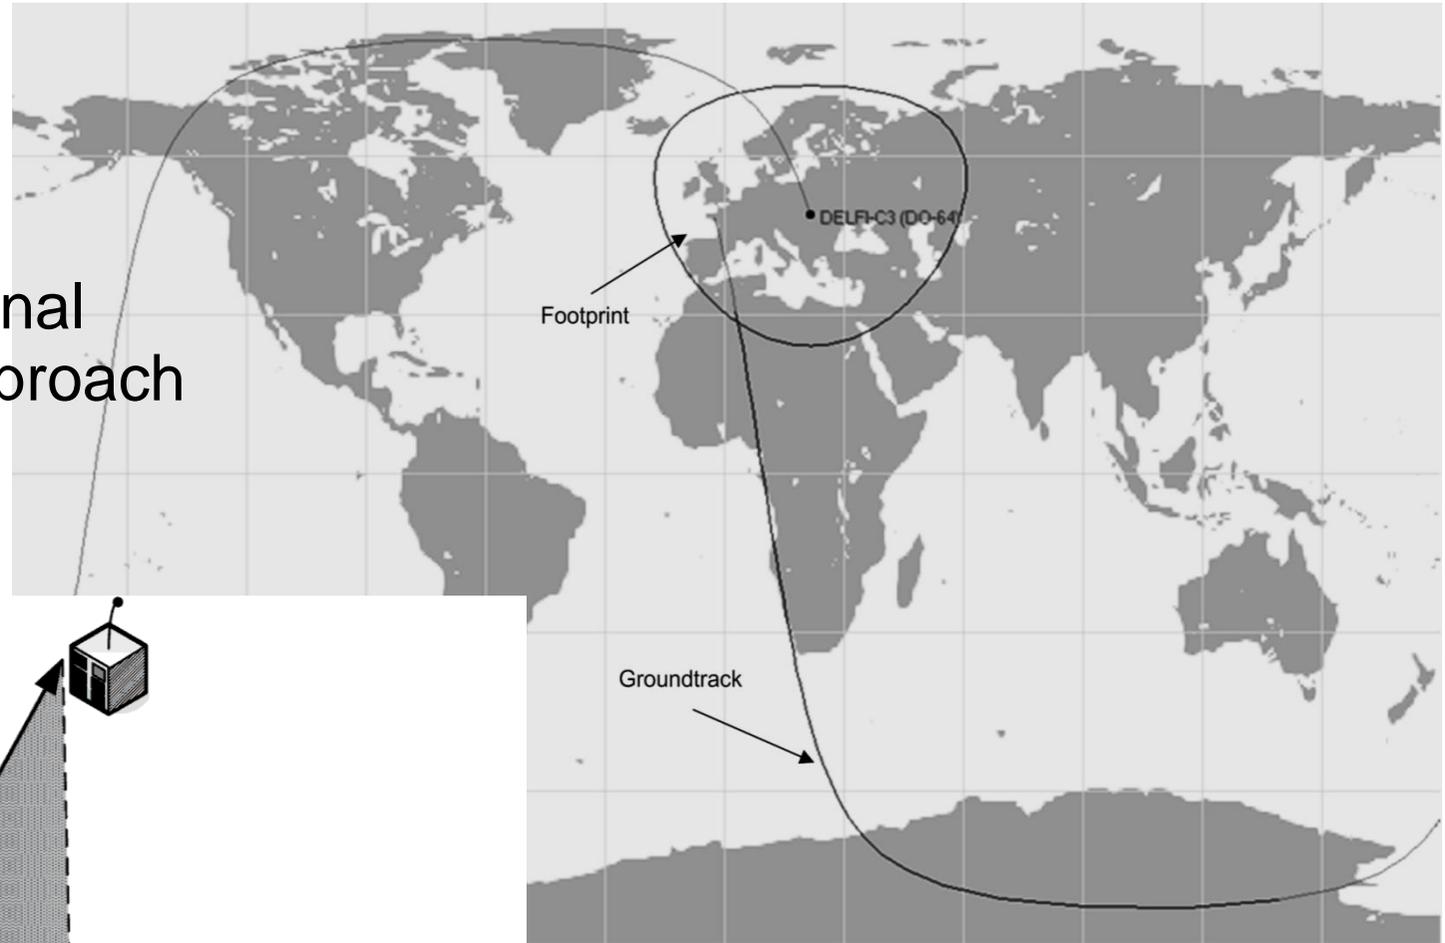

Satellietbanen

- Low-Earth-Orbit (LEO) banen
 - Satelliet komt ongeveer elke 1,5 uur over
 - Passage maximaal rond 15 minuten
 - Ongeveer 3 tot vier passages, dan weer tijdje 'niet-zichtbaar'
 - Noord → zuid of Zuid → noord
- Footprint
 - 'Dekking' van de satelliet

Satellietbanen

AOS Aquisition of Signal
TCA Time Closed Approach
LOS Loss of Signal

```

- Two-line elements
- Verkrijgbaar via internet

<http://www.celestrak.com/NORAD/elements/>

...

- Software begrijpt deze TLE's

Doppler (1)

- Voorbeelden
 - Formule 1
 - Politie/Ambulance
 - Trein overweg
- Frequentieverschuiving
 - Door snelheidsverschil
 - Ook voor satelliet signalen
- Typische LEO-passage:
 - 145 MHz ~ 3 kHz
 - 435 MHz ~ 10 kHz
 - 2400 MHz ~ 50 kHz (!)

$$f_w = f_b \left(\frac{v}{v - v_b} \right)$$

en bij verwijdering van de waarnemer:

$$f_w = f_b \left(\frac{v}{v + v_b} \right)$$

met

- f_b de echte frequentie van de golf die de bron uitzendt,
- v de voortplantingssnelheid van de golf in het medium en
- v_b de snelheid waarmee de golfbron beweegt in de richting van de waarnemer,

Doppler (2)

- Goed te voorspellen als je weet:

- Waar jij (stil) zit
- Waar de sateliet is
- Hoe snel de satelliet gaat

FO19 CW 437 MHz

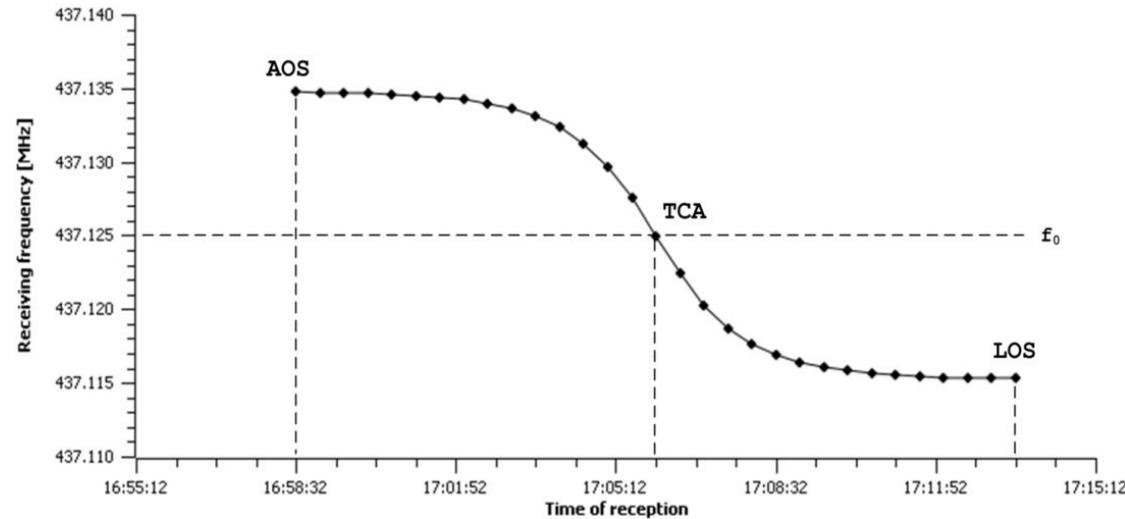

- Grootst

- bij AOS en LOS

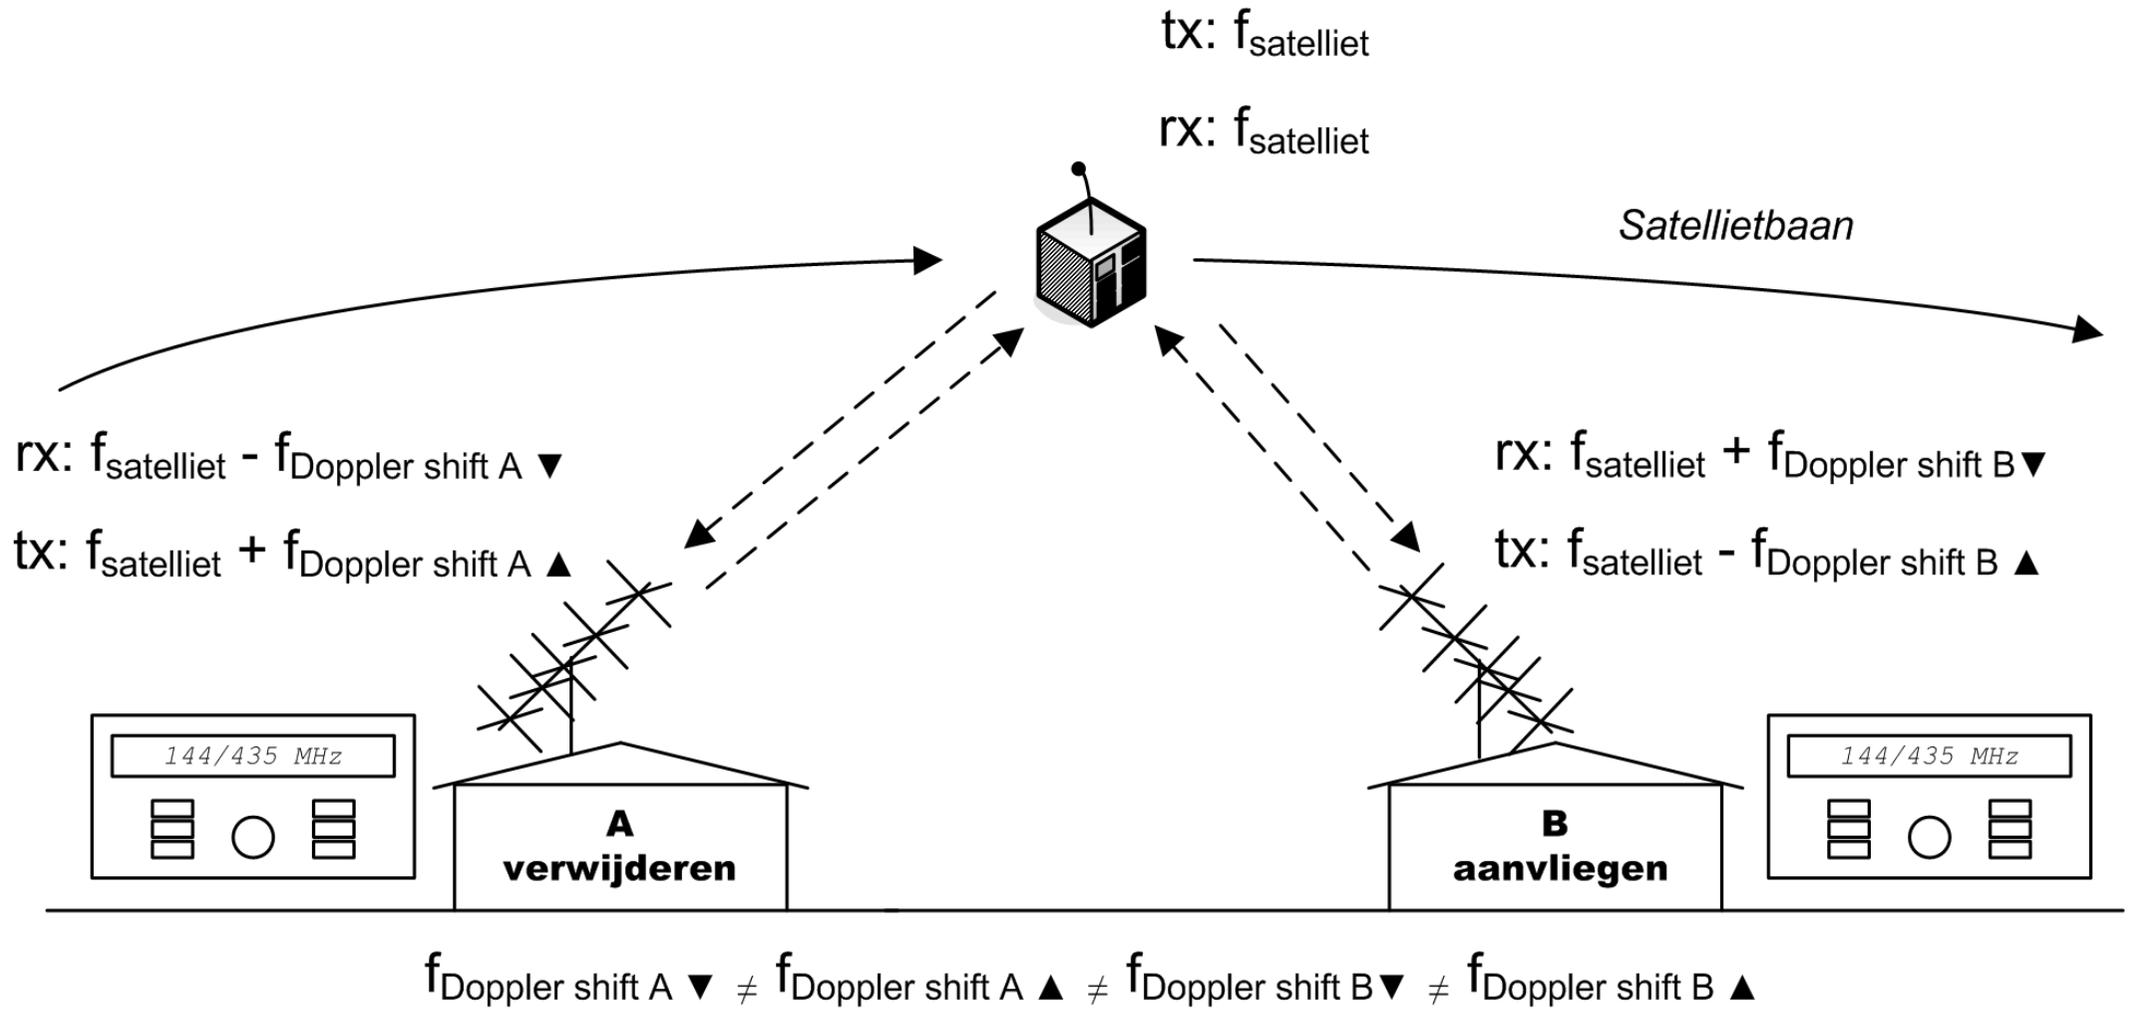

- Nul (heel-heel-even)

- bij TCA

- Verandering van frequentie grootst bij TCA!

Doppler (3)

Software

- PC:

- NOVA
- Orbitron
- SATPC32

Apparatuur: Antennes

- $\frac{1}{4}$ golf rondstraler werkt aardig
 - Bijvoorbeeld voor ISS
 - Geeft niet het beste resultaat
- Richtingsgevoelige antenne is beter
 - 4 elements (145 MHz) of 7 elements (435 MHz)
 - Meer elementen \rightarrow meer winst
maar: een kleinere openings hoek!
 - Voorbeelden: Arrow, DL6WU, DK7ZB

Apparatuur: Rotoren

- Antenne moet de satelliet 'volgen'
 - Horizontaal (Azimuth: 360 graden)
 - Verticaal (Elevatie: 90 graden)
 - Redelijk nauwkeurig (5 graden)
 - Openingshoek richt-antenne is klein
- Behoorlijk snel:
 - 45 .. 90 .. 45 graden elevatie in <5 minuten
 - Optie: elevatie vast op 25 graden
 - Satelliet meeste tijd <40 graden elevatie
- Computer sturing (interface)
 - Zelfbouw of bouwpakket

Apparatuur: Voorversterkers, Filters, Coax, ..

- Mode-J filter

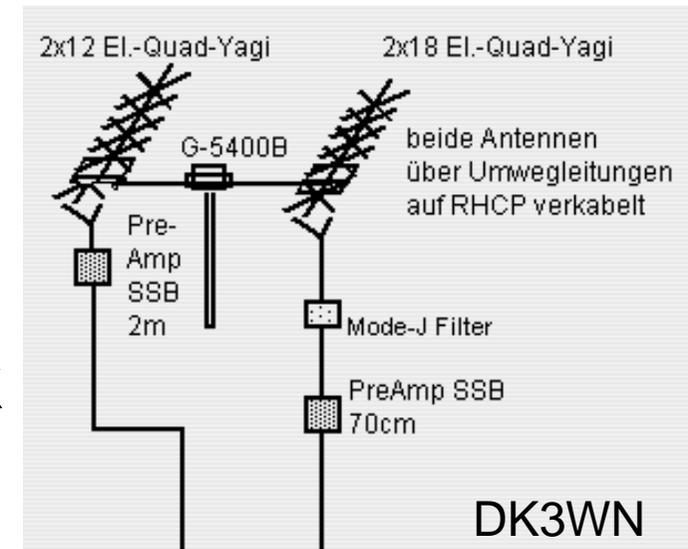

- Invloed TX op RX (harmonische)
- 145 MHz uplink op 435 MHz downlink

- Antennekabel (coax)

- Portabele (<2 meter): gewoon RG58 gebruiken
- Bij vaste opstellingen lang (rotor lussen etc.)
 - Gebruik dan liefst een goede coax

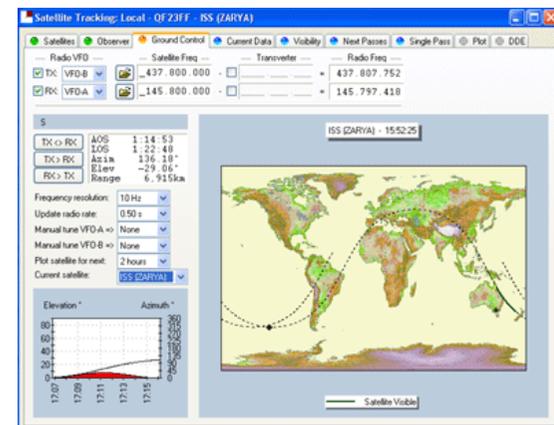

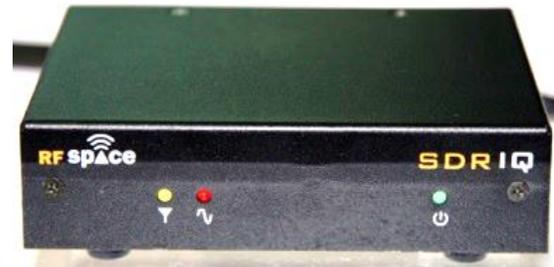

- Voorversterkers

- Compenseren verlies door lange antennekabels (coax)
- Niet nodig voor betere SNR (ontvanger goed genoeg)

Apparatuur: Transceivers

- Full-duplex?
 - Geïntegreerde full-duplex set is fraai
 - Maar twee losse sets gaat ook prima!
 - All-mode 2m en 70cm beste eerste keus
- Wees creatief
 - Zonder de nieuwste set kan het ook!
 - Bijvoorbeeld SDR + TX
- Doppler correctie
 - Handmatig
 - Automatisch (PC)

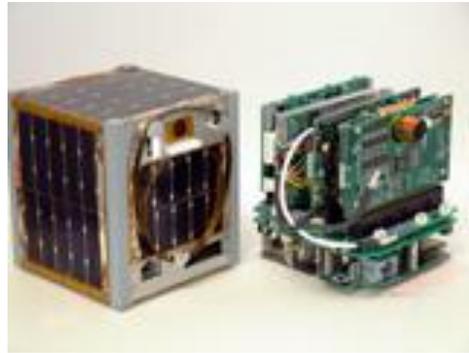

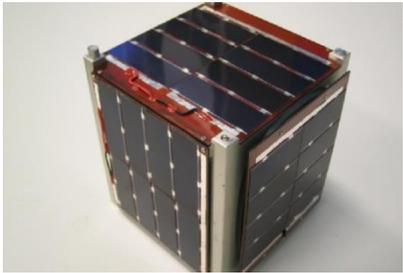

Zendamateurs en Cubesats

Demonstratie

Zendamateurs en Cubesats

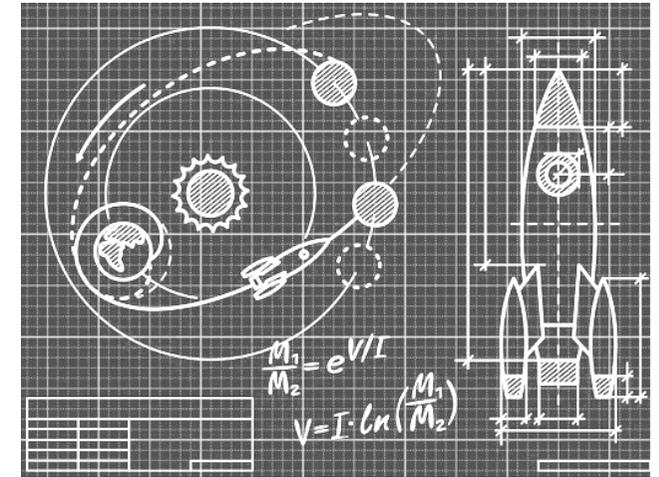

SEEDS II (CO-66)	21:01 - 21:13	30°	437.485	CW	90mW
CU XI-V(CO-58)	21:12 - 21:26	83°	437.465	CW	80mW

ISS	21:25 - 21:34	13°	145.825	FM	10-25W

Zendamateurs en Cubesats

- OK... dus wat kunnen we doen BEHALVE gebruik maken van Amateur Satelieten?
- Wetenschappelijke Experimenten!
- RAFT, ANDE1, ANDE2, ..
- RAX, Aggiesat, Nanosail, O/OREOS
- + vele Japanese projecten

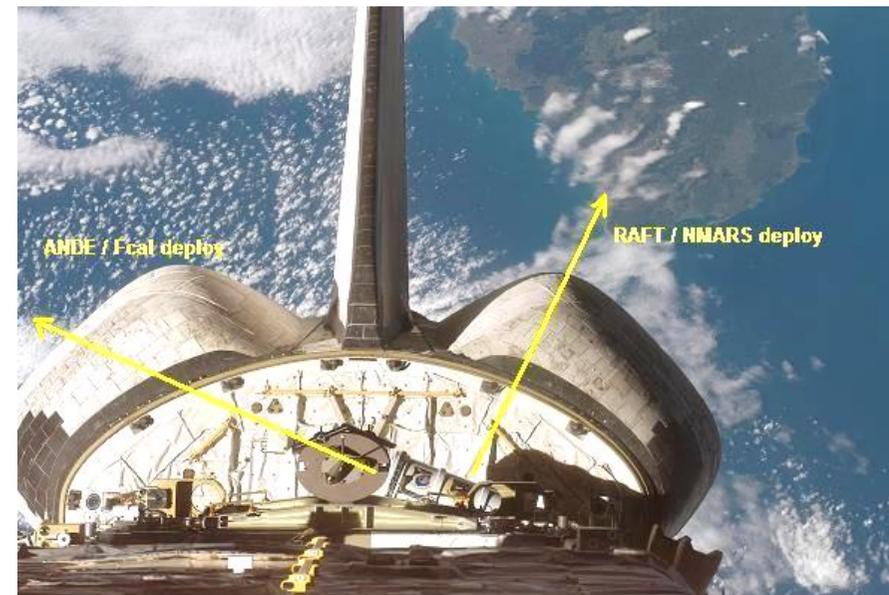

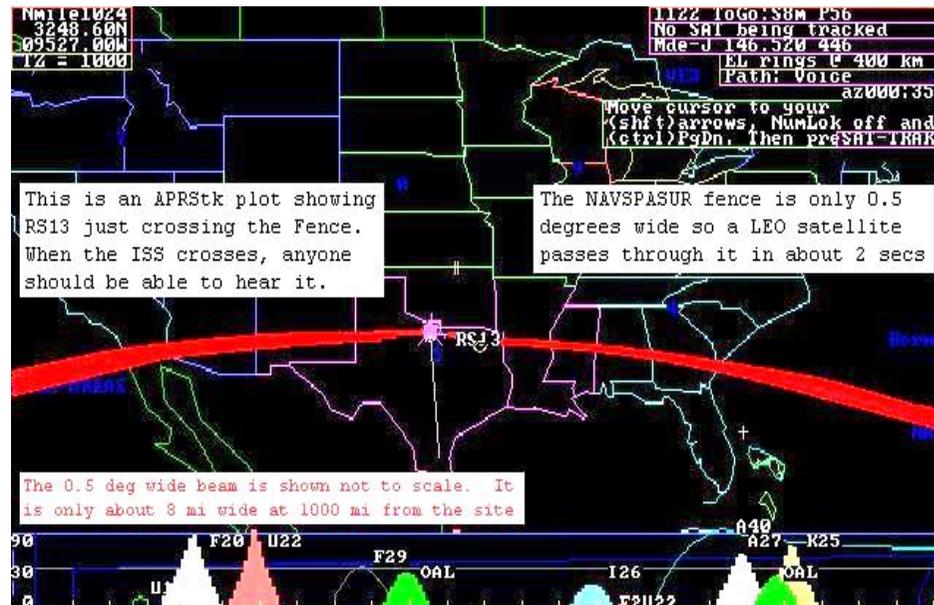

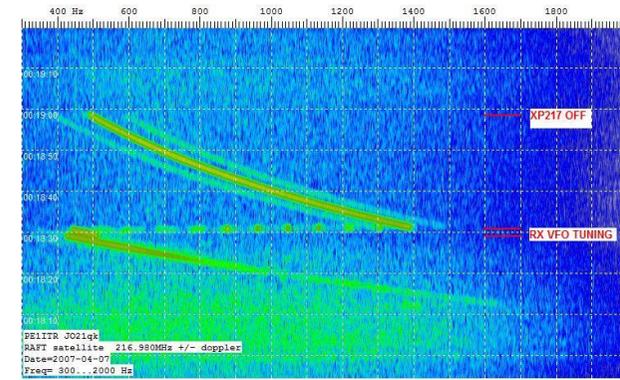

Daarom zijn Radio Amateurs belangrijk!

- Radiocommunicatie
 - Niet onderzoeks-hoofddoel van de universiteiten
- Footprint / access
 - Spannende momenten: direct na lancering
 - Meer contacttijd: meer data
- Ervaring is beschikbaar
 - Bewezen radio-installatie & operators staan klaar
 - Ook tijdens weekenden
 - Bepalen van de juiste Kepler set's na lancering

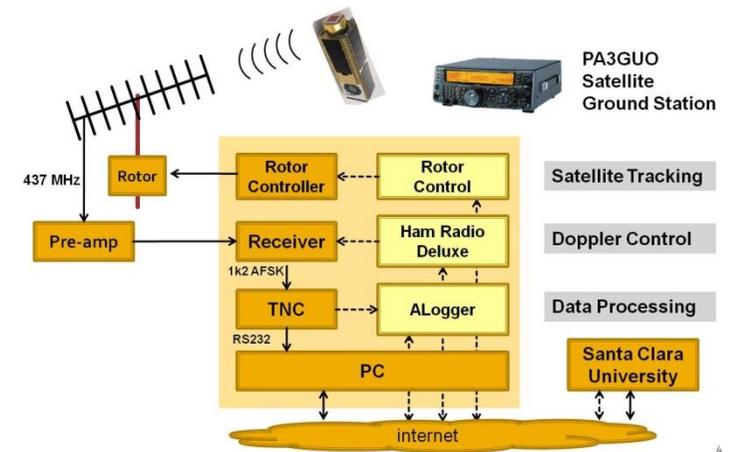

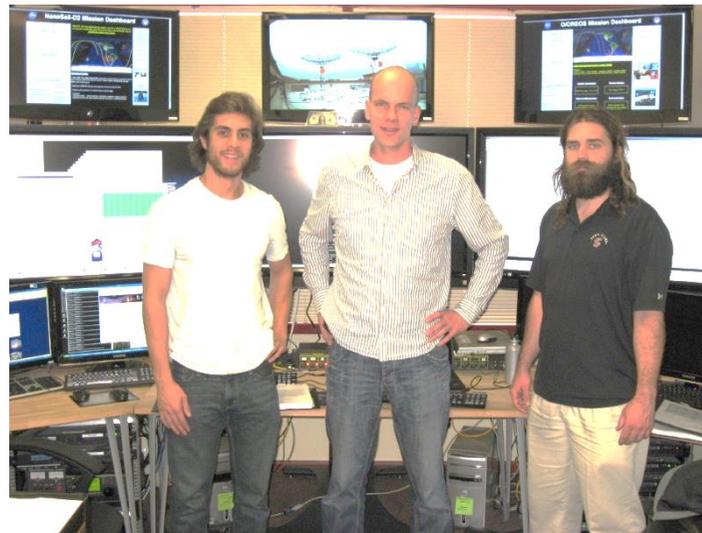

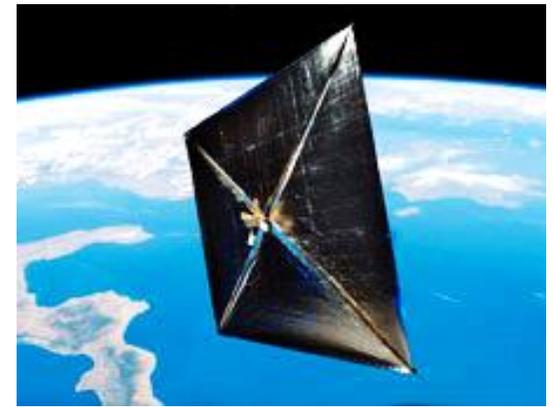

RAFT, ANDE, MARS, FCAL

- USNA Satellite, Bob Bruninga
- PE1ITR/Rob, DK3WN/Mike, PA3GUO/Henk
- RAFT moest bewezen worden boven US (vliegend door de 'radar fence')

Nanosail & O/OREOS

- NASA projects
- Ondersteund door SCU (San Jose)

- FASTSAT Lancering, geen 'deploy', en 'her-ontdekt'
- Sail Deployment over Spain

RAX

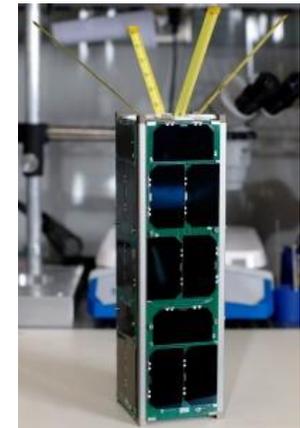

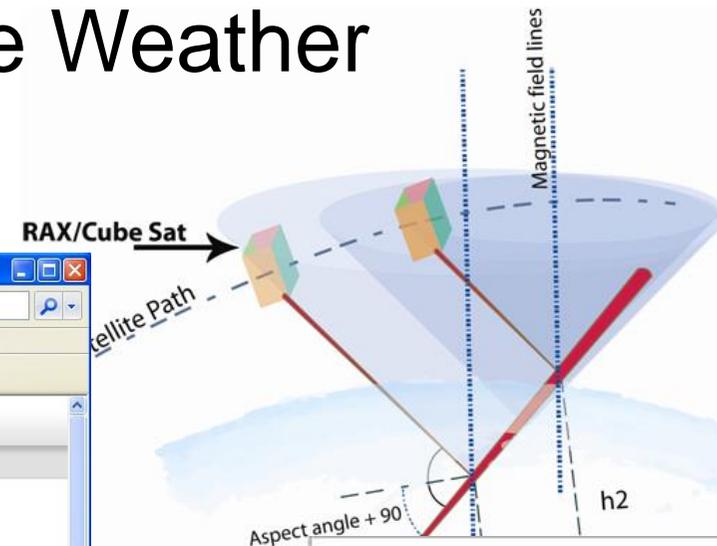

- University of Michigan, James Cutler
- Onderzoek van Space Weather
